

Press release wpi 603a / 0318

Area: Feedback systems for valves and valve actuators

Preview: Modern valve monitoring.

Cologne, March 2018 – ifm presents a new intelligent sensor for valves: the smart valve sensor. Whether open, closed or intermediate position, it detects any position of the valve to the nearest degree.

"See" what happens in the valve

Today valves can be found in almost every production process. They control the inflow of different media. Over time, wear or deposits may occur in the seal area. Here the intelligent valve sensor comes into play: it detects even minor position changes of the end positions in the valve and provides condition values via the integrated IO-Link interface. The new smart valve sensor from ifm offers continuous and reliable monitoring of any valve. The new device will be available as of Hannover Messe 2018.
