1 Preliminary note

1.1 Symbols used

► Instruction

> Reaction, result

[...] Designation of keys, buttons or indications

→ Cross-reference

⚠ Important note

Non-compliance can result in malfunction or interference.

ℹ Information

Supplementary note.

1.2 Warning signs used

⚠ CAUTION

Warning of personal injury.
Slight reversible injuries may result.

2 Safety instructions

• The device described is a subcomponent for integration into a system.
  - The manufacturer of the system is responsible for the safety of the system.
  - The system manufacturer undertakes to perform a risk assessment and to create a documentation in accordance with legal and normative requirements to be provided to the operator and user of the system. This documentation must contain all necessary information and safety instructions for the operator, the user and, if applicable, for any service personnel authorised by the manufacturer of the system.

• Read this document before setting up the product and keep it during the entire service life.

• The product must be suitable for the corresponding applications and environmental conditions without any restrictions.

• Only use the product for its intended purpose (→ Functions and features).

• If the operating instructions or the technical data are not adhered to, personal injury and/or damage to property may occur.
• The manufacturer assumes no liability or warranty for any consequences caused by tampering with the product or incorrect use by the operator.
• Installation, electrical connection, set-up, operation and maintenance of the unit must be carried out by qualified personnel authorised by the machine operator.
• Protect units and cables against damage.

3 Functions and features
Pressure Equipment Directive (PED): The units comply with section 3, article 3 of the Directive 97/23/EC and must be designed and manufactured for non-superheated liquids of group 2 fluids in accordance with the sound engineering practice. The unit monitors liquid media.
The unit detects the 3 process categories volumetric flow quantity, consumed quantity and medium temperature.

Application area
Conductive liquids with the following properties:
• Conductivity: ≥ 20 µS/cm
• Viscosity: < 70 mm²/s at 40 °C; < 70 cST at 104 °F

⚠ This is a class A product. This unit may cause radio interference in domestic areas.
► If required, take appropriate EMC screening measures.
4 Function

- The unit detects the flow based on the magnetic-inductive volumetric flow measuring principle.
- The unit also detects the medium temperature.
- It features an IO-Link interface.
- The unit displays the current process value.

4.1 Processing of the measured signals

The unit generates 2 output signals according to the parameter setting.

OUT1/IO-Link: Parameter setting
- Analogue signal for temperature (→ 10.2)
- Communication interface (→ 10.5.5)

OUT2: Parameter setting
- Analogue signal for volumetric flow quantity (→ 10.3)

4.2 Direction of flow

In addition to the flow velocity and the volumetric flow quantity, the unit also detects the direction of flow.

4.2.1 Determination of the direction of flow (Fdir)

An arrow with the text "flow direction" on the unit indicates the positive flow direction. The flow direction can be inversed (→ 10.4.4).

> Use the supplied label to mark the changed flow direction (new positive direction of flow).

<table>
<thead>
<tr>
<th>Flow...</th>
<th>Process value display</th>
</tr>
</thead>
<tbody>
<tr>
<td>corresponds to the marked flow direction</td>
<td>+ (positive)</td>
</tr>
<tr>
<td>against the marked flow direction</td>
<td>- (negative)</td>
</tr>
</tbody>
</table>

4.3 Consumed quantity meter

The unit has an internal mass flow meter which continuously totals the volumetric flow quantity. The total corresponds to the current consumed quantity.

- The quantity meter takes account of the flow direction for totalisation:
- Flow according to the marked flow direction (arrow "flow direction"): meter adds.

- Flow against the marked flow direction: meter subtracts.

The meter saves the totalled consumed quantity every 10 minutes. After a power failure this value is available as the current meter reading. So the possible data loss can be maximum 10 minutes.

The current meter reading can be evaluated via an external parameter setting software (→ 10.5.5 Activating the IO-Link communication interface).

4.4 Empty pipe detection

The unit detects when the two electrodes are not wetted by the medium. The empty pipe detection can be activated or deactivated (→ 10.4.7). If it is active and the pipe is empty, the unit reacts as follows:

> [SEnS] is indicated in the display.

> The flow is set to zero.

The empty pipe detection can be set as time-depending or not time depending (→ 10.4.8).

4.5 Analogue function

• The unit provides an analogue signal that is proportional to the volumetric flow quantity and the medium temperature.

• Within the measuring range the analogue signal is 4...20 mA.

• If the measured value is outside the measuring range or in the event of an internal error, the current signals indicated in Figure 1 are provided.

• The measuring range is scalable:
  [ASP] determines at which measured value the output signal is 4 mA.
  [AEP] determines at which measured value the output signal is 20 mA.

Minimum distance between [ASP] and [AEP] = 20 % of the final value of the measuring range.

Figure 1: Characteristics of the analogue output according to the standard IEC 60947-5-7.

- **Q**: Flow (a negative flow value means flow against the marked flow direction)
- **T**: Temperature
- **UL**: Below the display range
- **OL**: Above the display range
- **cr.UL**: Below the detection zone (error)
- **cr.OL**: Above the detection zone (error)
- **FOU=On**: Default setting at which the analogue signal goes to the upper final value in case of an error.*
- **FOU=OFF**: Default setting at which the analogue signal goes to the lower final value in case of an error.*

* The type of error is displayed: cr.UL, cr.OL, Err (→ 12).
4.6 Measured value damping (dAP)

The damping time allows to set after how many seconds the output signal has reached 63 % of the final value if the flow value changes suddenly. The set damping time stabilises the outputs, the display and the process value transfer via the IO-Link interface. The signals [UL] and [OL] (→ 12 Troubleshooting) are defined under consideration of the damping time.

4.7 Low flow cut-off (LFC)

With the function Low Flow cut-off small volumetric flow quantities can be ignored (→ 10.4.10). Flows below the LFC value are evaluated by the sensor as standstill (Q = 0).

4.8 Simulation

With this function flow and temperature values can be simulated. (→ 10.5.3). The outputs operate as previously set.

4.9 IO-Link

This unit has an IO-Link communication interface.

With a PC, suitable IO-Link software and an IO-Link adapter cable communication is possible when the system is not in operation.

The IODDs necessary for the configuration of the unit, detailed information about process data structure, diagnostic information, parameter addresses and the necessary information about the required IO-Link hardware and software can be found at www.ifm.com.

⚠️ The memory plug (E30398) must not remain connected to the unit, because it falsifies the analogue output. It must only be connected for parameter setting.
5 Installation

**CAUTION**

If the medium temperature is above 50 °C (122 °F) parts of the housing can increase in temperature to over 65 °C (149 °F).

> Risk of burns.

► Protect the housing against contact with flammable substances and unintentional contact.

► Attach the supplied warning label to the sensor cable.

► Ensure that the system is free of pressure during installation.

► Ensure that no media can leak at the mounting location during installation.

► Avoid deposits, accumulated gas and air in the pipe system.

The unit can be installed irrespective of the orientation if the following is ensured:

- No air bubbles can form in the pipe system.
- The pipes are always completely filled.

5.1 Recommended installation locations

Example of an optimised installation:

► Install the unit so that the measuring pipe is completely filled.

► Arrange for inlet and outlet pipe lengths. Disturbances caused by bends, valves, reductions, etc. are compensated for. It applies in particular: no shut-off and control devices are allowed directly in front of the unit.
S = disturbance; D = pipe diameter; F = flow direction

► Install in front of or in a rising pipe:

F = flow direction

► With empty pipe detection:

► Install the unit according to figure 1 or 3.
5.2 Not recommended installation position

- Avoid the following installation positions:

- Directly in front of a falling pipe.
- In a falling pipe.
- At the highest point of the pipe system.
- Directly in front of the spout of the pipe.
- On the suction side of a pump.

F = flow direction
5.3 Grounding

If installed in an ungrounded pipe system (e.g. plastic pipes), the unit must be grounded (functional earth).

Ground brackets for the M12 connector are available as accessories (→ www.ifm.com).

5.4 Installation in pipes

The units with a G thread can be installed in the pipes using adapters.

Information about the available mounting accessories at www.ifm.com.

A correct fit of the unit and ingress resistance of the connection are only ensured using ifm adapters.

1. Screw the adapter (B) into the pipe (A).
2. Place the seals (C) and install the unit according to the marked flow direction.
   ► To mount the adapters on the process connection of the sensor use suitable lubricants.
3. Screw the adapter (B) with the threads (D) until it is hand-tight.
4. Tighten the two adapters in opposite direction (tightening torque: 30 Nm).

After installation air bubbles in the system can affect the measurement.

Corrective measures:
   ► Rinse the system after installation for ventilation (rinsing quantity > 15 l/min; 4 gpm).
   In case of horizontal installation:
   As a result of design requirements a small quantity of the medium always remains in the measuring channel after switching off the pump.
6 Electrical connection

The unit must be connected by a qualified electrician.

The national and international regulations for the installation of electrical equipment must be adhered to.

Voltage supply according to EN 50178, SELV, PELV.

► Disconnect power.
► Connect the unit as follows:

Colours to DIN EN 60947-5-2

## 9 Set-up

After power on and expiry of the power-on delay time (approx. 5 seconds) the unit is in the normal operating mode. It carries out its measurement and evaluation functions and generates output signals according to the set parameters.

For the analogue output 2 (OUT2), the output signal is 20 mA during the power-on delay time.

In the first 2 seconds, analogue output 1 (OUT1) is passive and available for IO-Link communication. During the remaining power-on delay time, the output signal is at 20 mA.
10 Parameter setting

Parameters can be set before installation and set-up of the unit or during operation.

⚠️ If you change parameters during operation, this will influence the function.
► Ensure that there will be no malfunctions in your plant.

During parameter setting the unit remains in the operating mode. It continues to monitor with the existing parameter until the parameter setting has been completed.

⚠️ CAUTION

For medium temperatures above 50 °C (122 °F) some parts of the housing can heat up to over 65 °C (149 °F).
► Do not press the pushbuttons manually; instead use another object (e.g. ballpoint pen).
10.1 Parameter setting in general

Select parameter
2. Press [▲] or [▼] until the requested parameter is displayed.

Changing the parameter value
   > The currently set value is displayed.
4. Keep [▲] or [▼] pressed for 1 s.
   > Display flashes first, then permanent.
5. Change value by pressing [▲] or [▼].
   Keep [▲] or [▼] pressed.
   > Faster cycle of the numerical values.

Confirm the parameter value
   > The parameter is displayed again. The new setting value is saved.

Finish parameter setting and change to the process value display:
► Wait for 30 seconds
or
► Change from the submenu to the main menu, from the main menu to the process value display with [▲] or [▼].

If [C.Loc] is displayed when an attempt is made to modify a parameter value, an IO-Link communication is active (temporary locking).
If [S.Loc] is displayed, the sensor is permanently locked via software. This locking can only be removed with a parameter setting software.
10.1.1 Switching between the menu levels

| Change to the submenu | Switching to the next submenu via the parameters [EF], [CFG], [MEM], [EPD] or [SIM].  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>▶ Select a submenu with [▲] or [▼] and switch to the submenu by pressing [Enter].</td>
</tr>
</tbody>
</table>

| Back to the process value display | Wait for 30 seconds or Change from the submenu to the main menu, from the main menu to the process value display with [▲] or [▼]. |

10.1.2 Locking / unlocking

The unit can be locked electronically to prevent unintentional settings. On delivery: not locked.

Locking is also possible via an IO-Link capable parameter setting tool.

| Locking | Make sure that the unit is in the normal operating mode.  
|---------|------------------------------------------------------------------|
|         | ▶ Press [▲] and [▼] simultaneously for 10 s.  
|         | > [Loc] is displayed.  
|         | ▶ During operation: [Loc] is briefly displayed if you try to change parameter values. |

| Unlocking | Press [▲] and [▼] simultaneously for 10 s.  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&gt; [uLoc] is displayed.</td>
</tr>
</tbody>
</table>

10.1.3 Timeout

If no button is pressed for 30 s during parameter setting, the unit returns to the operating mode with unchanged parameter.

10.2 Setting the analogue value for temperature

▶ Select [ASP1] and set the value at which the minimum value is provided.  
▶ Select [AEP1] and set the value at which the maximum value is provided.

10.3 Setting the analogue value for volumetric flow

▶ Select [ASP2] and set the value at which the minimum value is provided.  
▶ Select [AEP2] and set the value at which the maximum value is provided.
10.4 User settings (optional)

10.4.1 Setting of the standard unit of measurement for temperature
► Select [Uni.T] and set the unit of measurement: °C or °F.

10.4.2 Setting of the standard unit of measurement for volumetric flow
► Select [Uni.F] and set the unit of measurement: [Lmin], [m³h], [gpm] or [gph]

10.4.3 Configuration of the standard display
► Select [SELd] and determine the standard measuring unit:
  - [FLOW] = the current volumetric flow value in the standard unit of measurement is displayed.
  - [TEMP] = the current medium temperature is displayed.
► Select [diS] and set the update rate and orientation of the display:
  - [d1] = update of the measured values every 50 ms.
  - [d2] = update of the measured values every 200 ms.
  - [d3] = update of the measured values every 600 ms.
  - [rd1], [rd2], [rd3] = display as for d1, d2, d3; rotated by 180°.
  - [OFF] = the display is switched off in the operating mode.

10.4.4 Changing the direction of the flow rate measurement
► Select [Fdir] and set the direction of flow:
  [+]= flow in the direction of the flow arrow (= factory setting)
  [-]= flow against the flow arrow ► label over the arrow

10.4.5 Setting of measured value damping
► Select [dAP] and set the damping constant in seconds (τ value 63 %).

10.4.6 Setting of the error behaviour of the outputs
► Select [FOU1] and set the value:
  - [On ] = the analogue signal goes to the upper fault value.
  - [OFF] = the analogue signal goes to the lower fault value.
  - [OU] = the analogue signal corresponds to the measured value.
► Select [FOU2] and set the value:
  - [On ] = the analogue signal goes to the upper fault value.
  - [OFF] = the analogue signal goes to the lower fault value.
  - [OU] = the analogue signal corresponds to the measured value.
### 10.4.7 Activating / deactivating empty pipe detection

- Select [EP.On] and set the function:
  - [OFF] = empty pipe detection deactivated.

### 10.4.8 Time-delay empty pipe detection

- Select [dEP.E] and set the delay time from 0…30 s, at which the signal should be provided when the pipe is empty.
- Select [dEP.F] and set the delay time from 0…30 s, at which the signal should be provided when the pipe is full.

### 10.4.9 Setting of the empty pipe detection

- Select [EP.Pr] to display the current value of the empty pipe detection in percent.
- Select [EP.SP] and set the switch point of empty pipe detection.

### 10.4.10 Setting of the low flow cut-off

- Select [LFC] and set the limit value.

### 10.5 Service functions

#### 10.5.1 Reading the min/max values for the volumetric flow

- Select [HI.F] or [LO.F]
  - [HI.F] = max. value, [LO.F] = min. value.

Delete memory:
- Select [HI.F] or [LO.F].
- Press [Enter] briefly.
- Keep [▲] or [▼] pressed.
  > [- - - -] is displayed.
- Press [Enter] briefly.

It makes sense to delete the memories as soon as the unit operates under normal operating conditions for the first time.
## 10.5.2 Reading the min/max values for the temperature

- Select [HI.T] or [LO.T].
  - [HI.T] = max. value, [LO.T] = min. value.

Delete memory:
- Select [HI.T] or [LO.T].
- Press [Enter] briefly.
- Keep [▲] or [▼] pressed.
- [----] is displayed.
- Press [Enter] briefly.

It makes sense to delete the memories as soon as the unit operates under normal operating conditions for the first time.

## 10.5.3 Simulation menu

- Select [S.FLW] and set the flow value to be simulated.
- Select [S.TMP] and set the temperature value to be simulated.
- Select [S.Tim] and set the time of the simulation in minutes.
- Select [S.On] and set the function:
  - [On]: The simulation starts. The values are simulated for the time set at [S.Tim]. [SIM] is displayed simultaneously with the process values. Cancel with [Enter].
  - [OFF]: The simulation is not active.

## 10.5.4 Resetting all parameters to factory setting

- Select [rES].
- Press [Enter] briefly.
- Keep [▲] or [▼] pressed.
- [----] is displayed.
- Press [Enter] briefly.

For the factory settings please refer to the end of these instructions → 14. We recommend taking down your own settings in that table before carrying out a reset.

## 10.5.5 Activating the IO-Link communication interface

- Select [IO-L] and set the function:
  - [OFF] = IO-Link interface deactivated.

⚠️ The analogue output OUT1 is deactivated when the IO-Link interface is activated.
11 Operation

11.1 Reading the process value

The LEDs 1-6 signal which process value is currently displayed.

The process value to be displayed as standard (temperature, flow velocity) can be preset. → 10.4.3 Configuration of the standard display. A standard unit of measurement can be defined for the flow velocity (l/min, m³/h, gpm or gph) → 10.4.2). For temperature measurement, °C or °F can be selected as standard unit of measurement (→ 10.4.1).

Further process values can be read in addition to the preset standard display:

► Press the buttons [▲] or [▼].

> The LED of the selected process value display is lit and the current process value is displayed.

> After 30 seconds the display changes to the standard display.

<table>

11.2 Reading the parameter value

Take the following steps to display the currently set parameter value:
Select parameter
1. Press [Enter] briefly
2. Press [▲] or [▼] until the requested parameter is displayed.

Display the parameter value
3. Press [Enter] briefly
   > The currently set value is displayed for 30 s.
   By pressing [Enter] briefly several times, the display switches between parameter and parameter value.

Switching to the process value display
► Wait for 30 seconds
or
► Change from the submenu to the main menu, from the main menu to the process value display with [▲] or [▼].

12 Troubleshooting
The unit has many self-diagnostic options. It monitors itself automatically during operation.
Warnings and error states are displayed, even when the display is switched off. Error indications are also available via IO-Link.
