1 Safety instructions

- Please read this document prior to set-up of the unit. Ensure that the product is suitable for your application without any restrictions.
- If the operating instructions or the technical data are not adhered to, personal injury and/or damage to property can occur.
- Improper or non-intended use may lead to malfunctions of the unit or to unwanted effects in your application. That is why installation, electrical connection, set-up, operation and maintenance of the unit must only be carried out by qualified personnel authorised by the machine operator.
- Check the compatibility of the product materials (→ Technical data) with the media to be measured in all applications.
- The responsibility whether the measurement devices are suitable for the respective application lies with the operator. The manufacturer assumes no liability for consequences of misuse by the operator. Improper installation and use of the devices result in a loss of the warranty claims.

2 Functions and features

The unit monitors the system temperature in machinery and plants.

3 Function

- The unit displays the current system temperature.
- It features an IO-Link interface and is designed for full bidirectional communication.
- The unit generates 2 output signals according to the parameter setting:
  - OUT1/IO-Link: Switching signal, limit values for temperature
  - OUT2: Analogue signal for temperature
3.1 Switching function

OUT1 changes its switching status if it is above or below the set switching limits. Hysteresis or window function can be selected.

When the hysteresis function is set, the set point (SP1) is defined first and then the reset point (rP1) which must be of a lower value. If only the set point is changed, the reset point remains constant.

When set to the window function the upper limit value (FH1) and the lower limit value (FL1) have a fixed hysteresis of 0.25 % of the final value of the measuring range. This keeps the switching state of the output stable if the temperature varies slightly.
3.2 Analogue function

- The unit converts the measured signal into a temperature-proportional analogue signal. Depending on the parameter setting the output signal is at:
  - 4...20 mA \([\text{ou2}] = I\)
  - 20...4 mA \([\text{ou2}] = I_{\text{neg}}\)
  - 0...10 V \([\text{ou2}] = U\)
  - 10...0 V \([\text{ou2}] = U_{\text{neg}}\)

- The analogue signal can be scaled, that means the limits of the measuring range for the lower output signal (ASP2 = analogue start point) and the upper output signal (AEP2 = analogue end point) can be set.

Minimum distance between [ASP2] and [AEP2] = 5 K.

3.2.1 Current output

\[
\begin{array}{|c|c|c|}
\hline
 & \text{[ou2]} = I & \text{[ou2]} = I_{\text{neg}} \\
\hline
\text{T < MAW (ASP2)} & 3.8...4 mA & 20.5...20 mA \\
\text{T > MEW (AEP2)} & 20...20.5 mA & 4...3.8 mA \\
\hline
\end{array}
\]

Within the measuring range the output signal is between 4 and 20 mA. If the temperature value (T) is outside the measuring range, the following output signal is displayed:
In case of internal fault, the output signal behaves according to the parameter set in \([\text{FOU2}]\):

<table>
<thead>
<tr>
<th></th>
<th>([\text{FOU2}] = \text{On})</th>
<th>([\text{FOU2}] = \text{OFF})</th>
</tr>
</thead>
<tbody>
<tr>
<td>([\text{ou2}] = \text{I})</td>
<td>21 mA</td>
<td>3.5 mA</td>
</tr>
<tr>
<td>([\text{ou2}] = \text{Ineg})</td>
<td>3.5 mA</td>
<td>21 mA</td>
</tr>
</tbody>
</table>

### 3.2.2 Voltage output

**Maximum measuring range at \([\text{ou2}] = \text{U}\)**

![Graph of maximum measuring range]

**Measuring range scaled at \([\text{ou2}] = \text{U}\)**

![Graph of measuring range scaled]

MAW = initial value of the measuring range  
MEW = final value of the measuring range  
ASP2 = analogue start point  
AEP2 = analogue end point

Within the measuring range the output signal is between 0 and 10 V.

If the temperature value (T) is outside the measuring range, the following output signal is displayed:

<table>
<thead>
<tr>
<th></th>
<th>([\text{ou2}] = \text{U})</th>
<th>([\text{ou2}] = \text{Uneg})</th>
</tr>
</thead>
<tbody>
<tr>
<td>(T &lt; \text{MAW (ASP2)})</td>
<td>0 V</td>
<td>10.3...10 V</td>
</tr>
<tr>
<td>(T &gt; \text{MEW (AEP2)})</td>
<td>10...10.3 V</td>
<td>0 V</td>
</tr>
</tbody>
</table>

In case of internal fault, the output signal behaves according to the parameter set in \([\text{FOU2}]\):

<table>
<thead>
<tr>
<th></th>
<th>([\text{FOU2}] = \text{On})</th>
<th>([\text{FOU2}] = \text{OFF})</th>
</tr>
</thead>
<tbody>
<tr>
<td>([\text{ou2}] = \text{U})</td>
<td>10.6 V</td>
<td>0 V</td>
</tr>
<tr>
<td>([\text{ou2}] = \text{Uneg})</td>
<td>0 V</td>
<td>10.6 V</td>
</tr>
</tbody>
</table>
3.3 Display colour change
The colour of the characters in the display can be set via the parameter [colr].
With the parameters rED (red) and GrEn (green), the display is permanently set to one colour. Via further parameters, the colour of the characters changes according to the measured value:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>OUT1</th>
<th>OUT1 and OUT2</th>
<th>Colour change to...</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1ou</td>
<td></td>
<td>r-cF</td>
<td>red</td>
</tr>
<tr>
<td>G1ou</td>
<td></td>
<td>G-cF</td>
<td>green</td>
</tr>
</tbody>
</table>

3.3.1 Parameter r1ou, G1ou

Hysteresis function:
Colour change if measured value is above the switch point

Window function:
Colour change if measured value is within the window range

MAW = initial value of the measuring range
MEW = final value of the measuring range
3.3.2 Parameter r-cF, G-cF

![Parameter r-cF, G-cF](image)

Colour change if the measured value is within definable limits.

3.4 IO-Link

3.4.1 General information

This unit has an IO-Link communication interface which requires an IO-Link-capable module (IO-Link master) for operation.

The IO-Link interface enables direct access to the process and diagnostic data and provides the possibility to set the parameters of the unit during operation.

In addition communication is possible via a point-to-point connection with a USB adapter cable.

You will find more detailed information about IO-Link at www.ifm.com/gb/io-link.

3.4.2 Device-specific information

You will find the IODDs necessary for the configuration of the IO-Link unit and detailed information about process data structure, diagnostic information and parameter addresses at www.ifm.com/gb/io-link.

3.4.3 Parameter setting tools

You will find all necessary information about the required IO-Link hardware and software at www.ifm.com/gb/io-link.

4 Installation

Using process adapters the unit can be adapted to different process connections. Adapters have to be ordered separately as accessories.

Immersion depth of the sensor: min. 12 mm in the pipe. If you use the adapter supplied as an accessory the correct immersion depth is ensured.
Mounting dimensions with M12 adapter

Mounting dimensions with G¼ adapter

Mounting dimensions with G½ adapter

Before installing and removing the unit: Ensure that no medium can leak at the process connection.

Grease the threads of the process connection (1), adapter (2) and nut (3).

The sensor tip (A) must not be in contact with grease.

Screw the suitable adapter into the process connection.

Place the temperature sensor onto the adapter and tighten the nut. Tightening torque max. 50 Nm. Ensure that the unit is correctly oriented.
5 Electrical connection

The unit must be connected by a qualified electrician. The national and international regulations for the installation of electrical equipment must be adhered to. Voltage supply to EN 50178, SELV, PELV.

- Disconnect power.
- Connect the unit as follows:

<table>
<thead>
<tr>
<th>Pin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 BN</td>
<td>L+</td>
</tr>
<tr>
<td>2 WH</td>
<td></td>
</tr>
<tr>
<td>3 BU</td>
<td>L-</td>
</tr>
<tr>
<td>4 BK</td>
<td></td>
</tr>
</tbody>
</table>

Colours to DIN EN 60947-5-2

Sample circuits:

1 x positive switching / 1 x analogue

- Switching signal: limit values for temperature
- IO-Link

1 x negative switching / 1 x analogue

- Analogue signal for temperature
### Operating and display elements

1. **1, 2, 3: Indicator LEDs**
   - LED 1 = switching status OUT1 (lights if output 1 is switched)
   - LED 2 = temperature in the indicated unit of measurement
   - LED 3 = no function

2. **4: Alphanumeric display, 4 digits**
   - Display of current temperature in red or green colour.
   - Display of the parameters and parameter values.

3. **5: Buttons up [▲] and down [▼]**
   - Select parameters
   - Change parameter values (hold button pressed)
   - Change of the display unit in the normal operating mode (RUN mode)
   - Locking / Unlocking (press buttons simultaneously > 10 seconds)

4. **6: Button [●] = Enter**
   - Change from the RUN mode to the main menu
   - Change to the setting mode
   - Acknowledge the set parameter value
7 Menu

7.1 Process value display (RUN) and menu structure

1) The parameters are only displayed when \([ou1] = Fno\) or \(Fnc\).

2) The parameters are only displayed when \([coLr] = r-cF\) or \(G-cF\).
7.2 Explanation of the menu

<table>
<thead>
<tr>

</tbody>
</table>

## 8 Parameter setting

Parameters can be set before installation and set-up of the unit or during operation.

⚠️ If you change parameters during operation, this will influence the function of the plant.

- Ensure that there will be no malfunctions in your plant.

During parameter setting the unit remains in the operating mode. It continues to monitor with the existing parameter until the parameter setting has been completed.

💡 The parameters can also be set via the IO-Link interface (→ 3.4).
8.1 Parameter setting in general

1. Change from the RUN mode to the main menu [●]
2. Select the requested parameter [▲] or [▼]
3. Change to the setting mode [●]
4. Modification of the parameter value [▲] or [▼] > 1 s
5. Acknowledge the set parameter value [●]
6. Return to the RUN mode → 8.1.2

Press [▲] + [▼] simultaneously to leave the setting mode without saving the changed parameter.

If [C.Loc] is displayed when attempting to change a parameter value, a change is made via a parameter setting software at the same time (temporary locking).

If [S.Loc] is displayed, the sensor is permanently locked via software. This locking can only be removed with a parameter setting software.

8.1.1 Change between the menus

1. Change from the RUN mode to the main menu [●]
2. Select parameter EF [▼]
3. Change to the submenu EF [●]
4. Select parameter CFG, MEM, DIS [▼]
5. Change to the submenu CFG, MEM, DIS [●]
6. Return to the next upper menu [▲] + [▼] simultaneously

8.1.2 Change to the process value display (RUN mode)
There are 3 possibilities:

I. Wait for 30 seconds (→ 8.1.4).
II. Press [▲] until the RUN mode is reached.
III. Press [▲] + [▼] simultaneously until the RUN mode is reached.
8.1.3 Locking / Unlocking

The unit can be locked electronically to prevent unintentional settings. On delivery: not locked.

| Locking | ► Make sure that the unit is in the normal operating mode.  
► Press [▲] and [▼] simultaneously for 10 s until [Loc] is displayed.  
► During operation: [Loc] is briefly displayed if you try to change parameter values. |
|---------|-------------------------------------------------------------------------------------------------|
| Unlocking | ► Make sure that the unit is in the normal operating mode.  
► Press [▲] and [▼] simultaneously for 10 s until [uLoc] is displayed. |

8.1.4 Timeout

If no button is pressed for 30 s during parameter setting, the unit returns to the operating mode with unchanged values.

8.1.5 Configure colour change display

► Select [coLr] and define the colour of the process value display: rEd, GrEn, r1ou, G1ou, r-cF, G-cF (→ 3.3).

8.1.6 Setting of the limit values for colour change

► Select [cFH] and set the upper limit value.  
► Select [cFL] and set the lower limit value.  

► [cFH] and [cFL] are only displayed if [coLr] = r-cF or G-cF.  
► [cFH] und [cFL] are irrespective of the default set points. The setting range corresponds to the measuring range and its minimum limit is [cFL] and its maximum limit is [cFH].
8.1.7 Read the min/max values

- Select [Hi] or [Lo] and read the value.
  
  [Hi] = max. value, [Lo] = min. value.

Delete memory:
- Select [Hi.T] or [Lo.T].
- Briefly press [●].
- Keep [▲] or [▼] pressed.
  > [----] is displayed.
- Briefly press [●].

> It makes sense to delete the memories as soon as the unit operates under normal operating conditions for the first time.

8.1.8 Resetting all parameters to factory setting

- Select [rES].
- Press [●].
- Press [▲] or [▼] and keep pressed until [----] is displayed.
- Briefly press [●].

> It is recommended to take down your own settings in the table before carrying out the function → 11 Factory setting.

9 Operation

After power on, the unit is in the RUN mode (= normal operating mode). It carries out its measurement and evaluation functions and provides output signals according to the set parameters.

9.1 Reading of the set parameters

- Briefly press [●].
- Click [▼] to select the parameter.
- Briefly press [●].

> The unit displays the corresponding parameter value for about 30 s. After that the unit returns to the RUN mode.
9.2 Error indications / self-diagnostics

<table>
<thead>
<tr>
<th>Display</th>
<th>Warning message</th>
</tr>
</thead>
<tbody>
<tr>
<td>[SC1]</td>
<td>Excessive current at OUT1. LED1 for OUT1 flashing.</td>
</tr>
<tr>
<td>[OL]</td>
<td>Detection zone exceeded.</td>
</tr>
<tr>
<td>[UL]</td>
<td>Below the detection zone.</td>
</tr>
</tbody>
</table>

Analogue signal in case of an error → 3.2.
