⚠ Important note

Non-compliance may result in malfunction or interference.

Information

Supplementary note.

2 Safety instructions

• Please read this document prior to set-up of the unit. Ensure that the product is suitable for your application without any restrictions.

• If the operating instructions or the technical data are not adhered to, personal injury and/or damage to property can occur.

• Improper or non-intended use may lead to malfunctions of the unit or to unwanted effects in your application. That is why installation, electrical connection, set-up, operation and maintenance of the unit must only be carried out by qualified personnel authorised by the machine operator.

• In order to guarantee the correct condition of the device for the operating time it is necessary to use the device only for media to which the wetted materials are sufficiently resistant (→ Technical data).

• The responsibility whether the measurement devices are suitable for the respective application lies with the operator. The manufacturer assumes no liability for consequences of misuse by the operator. Improper installation and use of the units result in a loss of the warranty claims.

• During installation or in case of a fault (housing damage) media under high pressure or hot media can leak from the system.

► Install the unit according to the applicable rules and regulations.

► Ensure that the system is free of pressure during installation.

► Ensure that no media can leak at the mounting location during installation.
► Equip the unit with suitable protection (e.g. cover) to avoid hazard to personnel from leaking media.

3 Functions and features
The unit monitors liquid media (water, glycol solutions, industrial oils, coolants). It detects the two process categories volumetric flow or medium temperature.

4 Function
- The unit detects the volumetric flow quantity based on the principle of differential pressure.
- The unit features an IO-Link interface and is designed for full bidirectional communication.
- The unit displays the current volumetric flow quantity or temperature. It generates 2 output signals according to the parameter setting:

OUT1/IO-Link: 4 selection options
- Switching signal: limit values for volumetric flow quantity → 9.2.1; → 9.2.2
- or switching signal: limit values for temperature → 9.3.1; → 9.3.2
- or frequency signal for volumetric flow quantity → 9.2.6
- or frequency signal for temperature → 9.3.6

OUT2: 4 selection options
- Switching signal: limit values for volumetric flow quantity → 9.2.3; → 9.2.4
- or switching signal: limit values for temperature → 9.3.3; → 9.3.4
- or analogue signal for volumetric flow quantity → 9.2.5
- or analogue signal for temperature → 9.3.5
4.1 Switching function

OUTx changes its switching status if it is above or below the set switching limits (flow or temperature). Hysteresis or window function can be selected. Example of volumetric flow monitoring:

**Hysteresis function**

![Hysteresis Diagram](image)

- **SP** = set point
- **rP** = reset point
- **HY** = hysteresis
- **Hno / Fno** = NO (normally open)

**Window function**

![Window Diagram](image)

- **FH** = upper limit value
- **FL** = lower limit value
- **FE** = window
- **Hnc / Fnc** = NC (normally closed)

---

When the hysteresis function is set, the set point (SP) is defined first and then the reset point (rP) which must be of a lower value. If only the set point is changed, the reset point remains constant.

When set to the window function the lower limit value (FL) and the upper limit value (FH) have a fixed hysteresis of 0.25 % of the final value of the measuring range. This keeps the switching status of the output stable if the volumetric flow varies slightly.
4.2 Analogue function

- The unit provides an analogue signal that is proportional to the volumetric flow quantity and the medium temperature.
- Within the measuring range the analogue signal is 4...20 mA.
- If the measured value is outside the measuring range or in the event of an internal error, the current signals indicated in Figure 1 and 2 are provided.

4.2.1 Volumetric flow monitoring

![Diagram](image)

Figure 1

1. Analogue signal
2. Volumetric flow quantity
3. Measuring range
4. Display range
5. Detection zone

MAW: Initial value of the measuring range
MEW: Final value of the measuring range
OL: Above the display range
Err: The unit is in the error state.
FOU=On: Default setting at which the analogue signal goes to the upper final value in case of an error.
FOU=OFF: Default setting at which the analogue signal goes to the lower final value in case of an error.
Figure 2

1. Analogue signal

3. Measuring range
4. Display range
5. Detection zone

MAW: Initial value of the measuring range
MEW: Final value of the measuring range
OL: Above the display range
UL: Below the display range
Err: The unit is in the error state.
FOU=On: Default setting at which the analogue signal goes to the upper final value in case of an error.
FOU=OFF: Default setting at which the analogue signal goes to the lower final value in case of an error.
4.3 Frequency output

The unit provides a frequency signal that is proportional to the volumetric flow quantity and the medium temperature.

Up to the limit value set under [FEP1] (for OUT1 = TEMP: between the limit values set under [FSP1] and [FEP1]) the frequency signal is between 0 Hz and the frequency value set under [FrP1].

![Diagram](image)

1. Frequency signal in Hz
2. Volumetric flow quantity or temperature
3. The device is in the error state (FOU = OFF) or the process value transmitted in an analogue way is below the display range or the current flow is 0.
4. The unit is in the error state (FOU = ON)
5. Medium temperature
6. Volumetric flow

4.4 IO-Link

This unit has an IO-Link communication interface which enables direct access to process and diagnostic data. In addition it is possible to set the parameters of the unit during operation. Operation of the unit via IO-Link interface requires an IO-Link capable module (IO-Link master).

With a PC, suitable IO-Link software and an IO-Link adapter cable communication is possible when the system is not in operation.
For the IODDs necessary for the configuration of the unit, detailed information about process data structure, diagnostic information, parameter addresses and the necessary information about the required IO-Link hardware and software visit www.ifm.com.

### 4.5 Colour change display (coLr)

The colour of the characters in the display can be set via the parameter [coLr] (→ 9.4.3). With the set parameters rED (red) and GrEn (green), the display is permanently set to one colour. If the parameters rxou and Gxou are set, the colour of the characters changes depending on the process value:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Hysteresis function:**
Colour change if process value is above the set set point

**Window function:**
Colour change if process value is within the window range

MAW = initial value of the measuring range, MEW = final value of the measuring range
5 Installation

- Insert the unit into the pipe according to the direction of flow (arrow) and tighten.

IN = inlet
OUT = outlet

- Baffled pipes on the sensor's inlet or outlet side are not necessary.

- The sensor has the function of a non-return valve.

- The sensor head can be rotated by 360°.

- The following minimum distances must be adhered to:

<table>
<thead>
<tr>
<th>Distance</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distance between the sensor and ferromagnetic materials.</td>
<td>≥ 30 mm</td>
</tr>
<tr>
<td>Distance between the sensor and constant / alternating fields.</td>
<td>≥ 500 mm</td>
</tr>
<tr>
<td>Distance between the sensor axes for side-by-side installation.</td>
<td>≥ 50 mm</td>
</tr>
</tbody>
</table>
5.1 Installation in case of water containing dirt

In case of water containing dirt, horizontal installation is recommended.

► Adhere to the inclination angle to the horizontal axis:

In clean water, installation in vertical pipes is also possible.

6 Electrical connection

The unit must be connected by a qualified electrician.

The national and international regulations for the installation of electrical equipment must be adhered to.

Voltage supply according to EN 50178, SELV, PELV.

► Disconnect power.

► Connect the unit as follows:

Colours to DIN EN 60947-5-2
Sample circuits:

2 x positive switching

1 x positive switching / 1 x analogue

2 x negative switching

1 x negative switching / 1 x analogue

### 1, 2, 3: Indicator LEDs
- LED 1 = switching status OUT1 (lights if output 1 is switched)
- LEDs 2 = flow or temperature in the indicated unit of measurement
- LED 3 = switching status OUT2 (lights if output 2 is switched)

### 4: Alphanumeric display, 4 digits
- Display of current process values (volumetric flow quantity, temperature)
- Display of the parameters and parameter values.

### 5: Buttons up [▲] and down [▼]
- Select parameters
- Change parameter values (hold button pressed)
- Change of the display unit in the normal operating mode (Run mode)
- Locking / Unlocking (press buttons simultaneously > 10 seconds)

### 6: Button [●] = Enter
- Change from the RUN mode to the main menu
- Change to the setting mode
- Acknowledge the set parameter value

9 Parameter setting

Parameters can be set before installation and set-up of the unit or during operation.

⚠️ If you change parameters during operation, this will influence the function of the plant.

► Ensure that there will be no malfunctions in your plant.

During parameter setting the unit remains in the operating mode. It continues to monitor with the existing parameter until the parameter setting has been completed.

ℹ️ The parameters can also be set via the IO-Link interface (→ 4.4).

9.1 Parameter setting in general

| 1. Change from the RUN mode to the main menu | ● |
| 2. Select the requested parameter | ▲ or ▼ |
| 3. Change to the setting mode | ● |
| 4. Modification of the parameter value | ▲ or ▼ > 1 s |
| 5. Acknowledge the set parameter value | ● |
| 6. Return to the RUN mode | → 9.1.3 |

If [C.Loc] is displayed when attempting to change a parameter value, a change is made via a parameter setting software at the same time (temporary locking).

If [S.Loc] is displayed, the sensor is permanently locked via software. This locking can only be removed with a parameter setting software.

9.1.1 Select submenu

► Click ▲ or ▼ to select submenu (EF, CFG, MEM, DIS).
► Briefly press ● to change to the submenu.

9.1.2 Exit parameter setting or menu level

► Press ▲ + ▼ simultaneously.
> Return to the next higher menu level. The changed parameter settings are not accepted.
9.1.3 Change to the process value display (RUN mode)
There are 3 possibilities:
1. Wait for 30 seconds (→ 9.1.5 Timeout).
2. Change from the submenu to the main menu, from the main menu to the process value display with [▲] or [▼].
3. Press [▲] + [▼] simultaneously until the RUN mode is reached.

9.1.4 Locking / Unlocking
The unit can be locked electronically to prevent unintentional settings. On delivery: not locked.
Locking:
► Make sure that the unit is in the normal operating mode.
► Press [▲] and [▼] simultaneously for 10 s until [Loc] is displayed.

During operation: [LOC] is briefly displayed if you try to change parameter values.
Unlocking:
► Make sure that the unit is in the normal operating mode.
► Press [▲] and [▼] simultaneously for 10 s until [uLoc] is displayed.

9.1.5 Timeout
If no button is pressed for 30 s during parameter setting, the unit returns to the operating mode with unchanged values.

9.2 Settings for consumed quantity monitoring
9.2.1 Limit value monitoring with OUT1 / hysteresis function

► Select [SEL1] and set [FLOW].
► Select [ou1] and set the switching function:
  - [Hno] = hysteresis function/normally open
  - [Hnc] = hysteresis function/normally closed
► Select [SP1] and set the value at which the output is set.
► Select [rP1] and set the value at which the output is reset.

Menu CFG: [SEL1] [ou1] 
Main menu: [SP1] [rP1]
### 9.2.2 Limit value monitoring with OUT1 / window function

- Select [SEL1] and set [FLOW].
- Select [ou1] and set the switching function:
  - [Fno] = window function/normally open
  - [Fnc] = window function/normally closed
- Select [FH1] and set the value at which the output switches.
- Select [FL1] and set the value at which the output is reset.

Menu CFG:
- [SEL1]
- [ou1]
Main menu:
- [FH1]
- [FL1]

### 9.2.3 Limit value monitoring with OUT2 / hysteresis function

- Select [SEL2] and set [FLOW].
- Select [ou2] and set the switching function:
  - [Hno] = hysteresis function/normally open
  - [Hnc] = hysteresis function/normally closed
- Select [SP2] and set the value at which the output is set.
- Select [rP2] and set the value at which the output is reset.

Menu CFG:
- [SEL2]
- [ou2]
Main menu:
- [SP2]
- [rP2]

### 9.2.4 Limit value monitoring with OUT2 / window function

- Select [SEL2] and set [FLOW].
- Select [ou2] and set the switching function:
  - [Fno] = window function/normally open
  - [Fnc] = window function/normally closed
- Select [FH2] and set the value at which the output switches.
- Select [FL2] and set the value at which the output is reset.

Menu CFG:
- [SEL2]
- [ou2]
Main menu:
- [FH2]
- [FL2]

### 9.2.5 Configure the analogue output for volumetric flow

- Select [SEL2] and set [FLOW].
- Select [ou2] and set the function:
  - [I] = current signal proportional to volumetric flow (4…20 mA)

Menu CFG:
- [SEL2]
- [ou2]

### 9.2.6 Configure the frequency signal for volumetric flow

- Select [SEL1] and set [FLOW].
- Select [ou1] and set [FRQ].
- Select [FEP1] and set the flow value at which the frequency set in FrP1 is provided.
- Select [FrP1] and set the frequency.

Menu CFG:
- [SEL1]
- [ou1]
Main menu:
- [FEP1]
- [FrP1]
9.3 Settings for temperature monitoring

9.3.1 Limit value monitoring with OUT1 / hysteresis function

- Select [SEL1] and set [TEMP].
- Select [ou1] and set the switching function:
  - [Hno] = hysteresis function/normally open
  - [Hnc] = hysteresis function/normally closed
- Select [SP1] and set the value at which the output is set.
- Select [rP1] and set the value at which the output is reset.

Menu CFG: [SEL1] [ou1]
Main menu: [SP1] [rP1]

9.3.2 Limit value monitoring with OUT1 / window function

- Select [SEL1] and set [TEMP].
- Select [ou1] and set the switching function:
  - [Fno] = window function/normally open
  - [Fnc] = window function/normally closed
- Select [FH1] and set the value at which the output switches.
- Select [FL1] and set the value at which the output is reset.

Menu CFG: [SEL1] [ou1]
Main menu: [FH1] [FL1]

9.3.3 Limit value monitoring with OUT2 / hysteresis function

- Select [SEL2] and set [TEMP].
- Select [ou2] and set the switching function:
  - [Hno] = hysteresis function/normally open
  - [Hnc] = hysteresis function/normally closed
- Select [SP2] and set the value at which the output is set.
- Select [rP2] and set the value at which the output is reset.

Menu CFG: [SEL2] [ou2]
Main menu: [SP2] [rP1]

9.3.4 Limit value monitoring with OUT2 / window function

- Select [SEL2] and set [TEMP].
- Select [ou2] and set the switching function:
  - [Fno] = window function/normally open
  - [Fnc] = window function/normally closed
- Select [FH2] and set the value at which the output switches.
- Select [FL2] and set the value at which the output is reset.

Menu CFG: [SEL2] [ou2]
Main menu: [FH2] [FL2]
9.3.5 Configure the analogue output for temperature

- Select [SEL2] and set [TEMP].
- Select [ou2] and set the function:
  - [I] = current signal proportional to volumetric flow (4…20 mA)

Menu CFG:
[SEL2] [ou2]

9.3.6 Configure the frequency signal for temperature

- Select [SEL1] and set [TEMP].
- Select [ou1] and set [FRQ].
- Select [FSP1] and set the lower temperature value at which 0 Hz is provided.
- Select [FEP1] and set the temperature value at which the frequency set in FrP1 is provided.
- Select [FrP1] and set the frequency.

Menu CFG:
[SEL1] [ou1]
Main menu:
[FSP1] [FEP1] [FrP1]

9.4 User settings (optional)

9.4.1 Set the standard unit of measurement for volumetric flow

- Select [uni] and set the unit of measurement: l/min, m³/h (SBN2xx: gpm, gph).

The selectable units of measurement depend on the respective unit.

Menu CFG:
[uni]

9.4.2 Configuration of the standard display

- Select [SELd] and determine the standard measuring unit:
  - [FLOW] = the current volumetric flow value in the standard unit of measurement is displayed.
  - [TEMP] = the current medium temperature in °C is displayed (SBN2xx: °F).

- Select [diS] and set the update rate and orientation of the display:
  - [d1]: update of the measured values every 50 ms.
  - [d2]: update of the measured values every 200 ms.
  - [d3]: update of the measured values every 600 ms.
  - [rd1], [rd2], [rd3]: display as for d1, d2, d3; rotated by 180°.
  - [OFF] = The measured value display is deactivated in the Run mode. The LEDs remain active even if the display is deactivated. Error messages are displayed even if the display is deactivated.

Menu DIS:
[SELd] [diS]
9.4.3 Configure colour change display
► Select [coLr] and define the colour of the process value display:
  - Red, Green, r1ou, G1ou, r2ou, G2ou (→ 4.5).
  Menu DIS: [coLr]

9.4.4 Set the damping for the switching output
► Select [dAP] and set the damping constant in seconds
  (τ value. 63 %); setting range 0...5 s.
  Menu CFG: [dAP]

9.4.5 Set damping for the analogue output
► Select [dAA] and set a damping constant in seconds.
  setting range 0...5 s.
  Menu CFG: [dAA]

9.4.6 Set output status in fault condition
► Select [FOU1] and set the value:
  1. Switching output:
     - [OFF] = output 1 switches OFF in case of an error.
     - [OU] = output 1 switches irrespective of the fault as defined with the
       parameters.
  2. Frequency output:
     - [On] = 130 % of FrP1.
     - [OFF] = 0 Hz
     - [ou1] = frequency signal is provided without any changes.

► Select [FOU2] and set the value:
  1. Switching output:
     - [OFF] = output 2 switches OFF in case of an error.
     - [OU] = output 2 switches irrespective of the fault as defined with the
       parameters.
  2. Analogue output
     - [On] = output 2 switches ON in case of an error, the analogue signal
       goes to the upper error value.
     - [OFF] = output 2 switches OFF in case of an error, the analogue signal
       goes to the lower error value.
     - [ou] = output 2 switches irrespective of the fault as defined with the
       parameters. The analogue signal corresponds to the measured value.
9.5 Service functions

9.5.1 Read the min/max values for the temperature

- Select [Hi.T] or [Lo.T] and read the value.
  - [Hi.T] = max. value, [Lo.T] = min. value.

Delete memory:
- Select [Hi.T] or [Lo.T].
- Briefly press [●].
- Keep [▲] or [▼] pressed.
- > [----] is displayed.
- > Briefly press [●].

It makes sense to delete the memories as soon as the unit operates under normal operating conditions for the first time.

Menu MEM:
- [Hi.T]
- [Lo.T]

9.5.2 Resetting all parameters to factory setting

- Select [rES].
- Press [●].
- Press [▲] or [▼] and keep pressed until [----] is displayed.
- Briefly press [●].

It is recommended to take down your own settings in the table before carrying out the function → 12 Factory setting.

Menu EF:
- [rES]

10 Operation

10.1 Reading the process value

The LEDs 1-3 signal which process value is currently displayed. The process value to be displayed as standard (temperature or volumetric) can be preset → 9.4.2 Configuration of the standard display. A standard unit of measurement can be defined for the volumetric flow quantity (l/min or m³/h, for SBN2xx: gpm or gph → 9.4.1).

In RUN mode, further process values can be read in addition to the preset standard display:

- Press the buttons [▲] or [▼].

  > The LED of the selected process value display is lit and the current process value is displayed.

  > After 30 seconds the display changes to the standard display.
10.2 Reading the set parameter value

1. Change from the RUN mode to the main menu  
   [●]

2. Select the requested parameter  
   [▲] or [▼]

3. Change to the setting mode  
   > The currently set value is displayed for 30 s.  
   By pressing [●] several times, the display switches between parameter and parameter value.

4. Return to the RUN mode without parameter change  
   → 9.1.3
